

AI Contribution Report with ChatGPT

This report highlights how artificial intelligence, specifically ChatGPT, was used to contribute directly to the development of the **Gatherly** platform. It showcases the prompt, the AI-generated code snippet, the rationale behind the solution, and its integration into the project's UI. The goal is to demonstrate how AI can support frontend feature development efficiently.

ChatGPT was asked to assist in enhancing the user interface by visually indicating which venues are hosted by the currently logged-in user. The feature needed to be subtle, non-intrusive, and context-aware, fitting naturally within the existing card-based venue layout.

Prompt Given to ChatGPT

On the venueCard, add a visual label that says "Hosted by You" if the currently logged-in user is the host of the venue. This label needs to be subtle and fit within the contents of the venueCard.

Prior to ChatGPT receiving this prompt, the all of the code in **<script setup>**, **<template>**, and **<style scoped>** in **venueCard.vue** was copied and pasted for chat to analyze. This method ensured that ChatGPT had complete context regarding the structure, logic, and styling of the component. This approach minimized back-and-forth confusion and made it easier for the developer to implement the changes.

ChatGPT generated a solution that includes:

- A conditional check (**isHost**) already present in the Vue component.
- A new **** element styled with custom CSS, positioned in the top-right of the card.
- Suggested integration point inside the **<template>** and a corresponding **<style scoped>** addition.

Response by ChatGPT

To add a "Hosted by You" label to the `venueCard.vue` component when the logged-in user is the host of the venue, follow the steps below.

✅ Update in `<template>` section

Inside the main content block, under the location or right above the price (anywhere it naturally fits), insert this block:

```
vueCopyEdit<p class="host-label mt-1" v-if="isHost">Hosted by You</p>
```

Put it just below this line:

```
vueCopyEdit<h5 class="card-title">{{ venueLocation }}</h5>
```

✅ Update in `<style scoped>` section

Add styling for `.host-label` to make it clean and subtle:

```
cssCopyEdit.host-label {
  font-size: 13px;
  color: var(--secondary);
  font-style: italic;
  opacity: 0.85;
}
```

Make sure this is placed inside the existing `<style scoped>` block.

🔗 No JS/Script Changes Needed

You already have the following computed value in `<script setup>` which determines host status:

```
jsCopyEditconst isHost = computed(() => venue.value.host === user?.id);
```

This will correctly show the label when appropriate.

✅ Summary

You are now showing a soft "Hosted by You" indicator for venues owned by the logged-in user. It's unobtrusive, visually consistent, and does not interfere with other elements on the card.

Integration Point

```
134 <router-link :to="`/venues/${venue._id}`" class="text-decoration-none">
135   <div class="mt-3 d-flex flex-column">
136     <h5 class="card-title">{{ venueLocation }}</h5>
137     <!-------AI Contribution----->
138     <p class="host-label mt-1" v-if="isHost">Hosted by You</p>
139
140
141     <p class="card-text">Unknown Miles Away</p>
142     <div class="d-flex justify-content-between">
143       <p class="card-text">{{ venue.price }} per day</p>
144     </div>
145   </div>
146 </router-link>
```

The snippet was integrated inside the `<div class="image-container">` of `VenueCard.vue`, ensuring that the label overlays the image cleanly.

Styling

```
216 <style scoped>
217   .host-label {
218     font-size: 13px;
219     color: var(--secondary);
220     font-style: italic;
221     opacity: 0.85;
222   }
223
```

AI recommended styling is used in `<style scoped>` to complete the AI contribution.

Result of the Contribution

The result of this contribution can be seen on each venue card, specifically just below the venue’s location. A subtle label that reads “*Hosted by You*” now appears on any venue where the currently logged-in user is also the host. This dynamic display element was generated and implemented using AI assistance. It enhances user clarity by visually distinguishing the user’s own listings from others, while maintaining the clean aesthetic of the **venueCard** component.
